

Setup HAProxy Monitoring using Prometheus and Grafana

HAProxy currently provides exceptional visibility through its Stats page, which displays more than 100 metrics. It can be consumed as a CSV-formatted feed—although you can also use the Runtime API to export the data as JSON. CSV is perhaps one of the easiest formats to parse and, as an effect, many monitoring tools utilize the Stats page to get near-real-time statistics from HAProxy. In particular, many users have benefited from the HAProxy Exporter for Prometheus, which consumes the HAProxy Stats page and converts the data to the Prometheus time series.

Tasks:

1. Install Prometheus-HAproxy-exporter
2. Configuration HAproxy - stats
3. Configuration Prometheus targets
4. Configure Dashboard in Grafana

STEP 1 :

Install Prometheus-HAproxy-Exporter

Server : HAproxy

Update the system packages :

```
sudo apt update
```

Install HAproxy-Exporter :

```
sudo apt install prometheus-haproxy-exporter
```

Check the service status :

```
sudo systemctl status prometheus-haproxy-exporter
```

STEP 2 :

Configuration HAproxy - stats

Server : HAproxy

HAproxy server IP : x.x.5.139

Edit the config file HAproxy :

```
sudo nano /etc/haproxy/haproxy.cfg
```

Add this configuration to the file :

```
frontend stats
```

```
    bind x.x.5.139:8080
```

```
    option http-use-htx
```

```
    http-request use-service prometheus-exporter if { path /metrics }
```

```
stats enable
```

```
stats uri /stats2
```

```
stats refresh 10s
```

restart service HAproxy :

```
sudo systemctl restart haproxy.service
```

STEP 3 :

Configuration Prometheus targets

Server : prometheus

Change IP-server-Haproxy-exporter with your server IP where you have setup HAproxy exporter

Edit the config file Prometheus :

```
sudo nano /etc/prometheus/prometheus.yml
```

Add this configuration to the file :

```
- job_name: 'HAproxy_exporter'
```

```
  scrape_interval: 5s
```

```
  static_configs:
```

```
    - targets: [x.x.5.139:8080']
```

restart service Prometheus :

```
sudo systemctl restart prometheus.service
```

Check the target in prometheus web UI :

<http://<prometheus-IP>:9090/targets>

STEP 4 :

Configure Dashboard in Grafana

Server : grafana

view grafana web UI :

<http://<grafana-IP>:3000>

login to grafana :

user: admin

pass: admin

create Dashboard In Grafana :

Dashboards ☐ new dashboard ☐ add a new panel ☐

Set metrics :

haproxy_server_total_time_average_seconds

haproxy_server_current_sessions

haproxy_server_bytes_in_total

haproxy_server_bytes_out_total

haproxy_server_downtime_seconds_total

haproxy_server_weight

haproxy_backend_active_servers

haproxy_server_sessions_total

haproxy_backend_sessions_total

haproxy_server_loadbalanced_total

Successful

END
